

## Mask output of `The following objects are masked from....` after calling attach() function

[Ask Question](#)

I wonder if there is a way to mask the long list output of

The following objects are masked from XXX(position 11): every time I call attach() function?

r

## 2 Answers

You use attach without detach - every time you do it new call to attach masks objects attached before (they contain the same names). Either use detach or do not use attach at all. Nice discussion and tips are

Even after detaching, and then attaching, I got the same warning message. Any alternative suggestions this.? – [Argho Chatterjee](#)

If you look at the down arrow in environment tab. The attached file can appear multiple times. You may need to highlight and run `detach(filename)` several times until all cases are gone then `attach(newfilename)` should have no output message.
